State projections

State-level projections were made using a cohort-component methodology in which births, deaths and migration were projected separately for each age-sex cohort in the population. The base was the April 1, 1980 population of Florida as enumerated in the decennial census. Survival rates were applied to each age-sex cohort to project future mortality. These rates were based on Florida Life Tables for 1980 prepared by the Public Health Statistics Section of the Florida Department of Health and Rehabilitative Services. The survival rates were adjusted upward in 1990 to account for projected increases in life expectancy (U.S. Census Bureau, *Current Population Reports*, Series P-25, No. 601, October 1975).

Migration rates were based on 1980 census data regarding migration behavior between 1975 and 1980. Inmigration rates were calculated by dividing 1975-1980 migration into Florida by the 1975 population of the United States (minus Florida) for each age-sex cohort. Outmigration rates were calculated by dividing 1975-1980 migration out of Florida by the 1975 Florida population for each age-sex cohort. Projections of inmigration were then made by applying inmigration rates to the population of the United States (minus Florida), and projections of outmigration were made by applying outmigration rates to the Florida population. The projections of the United States population were taken from *Current Population Reports*, Series P-25, No. 952, May 1984.

Projections were made in five-year intervals, with each projection serving as the base for the following projection. Projected inmigration for each five-year interval was added to the survived Florida population at the end of that interval, and projected outmigration was subtracted, giving a projection of the population age five and older. Births and net migration of children less than age five were projected by applying age-specific birth rates (adjusted for child mortality) to the projected female population. These birth rates were based on Florida birth data between 1980 and 1985, and imply a total fertility rate of 1.9 births per woman. The 1985 projection was adjusted to be consistent with the 1985 total population estimate, and the 1990 projection was adjusted to be consistent with the 1990 projection produced by the State of Florida's economic forecasting model. The 1986 age and sex estimates published here were an interpolation between the 1985 estimates and the 1990 projections, and were controlled to the Bureau's 1986 estimate of total population.

In Florida, approximately 90 percent of population growth is due to net migration and only 10 percent is due to natural increase (i.e. the excess of births over deaths). The assumptions regarding future migration are therefore the most critical in projections of Florida population. We have used three different migration assumptions, yielding three series of population projections. In the low series, a weight of 0.9 was applied to the migration rates for each age-sex cohort. This series projects net inmigration (i.e. the excess of inmigrants over outmigrants) of 150,000-200,000 per year between 1985 and 2000, about the same as the low-growth years of the 1970s. The medium series was based on a weight of 1.15, yielding net migration inflows of 240,000-280,000 per year, about the average for Florida during the 1970s and first half of the 1980s. The high series was based on a weight of 1.4, yielding net migration inflows of 330,000-370,000 per year, about the same as the high-growth years of the 1970s and 1980s. The numbers published in this bulletin were taken from the medium series, which we believe is most likely to provide accurate forecasts of Florida's future population.

County level

County projections were made in a manner very similar to that used for the state projections. Survival rates and outmigration rates were applied to each age-sex cohort to project the number surviving and moving out; inmigration rates were applied to each age-sex cohort in the United States population to project the number moving in; and age-specific birth rates were applied to the female population to project the number of births and net migration of children less than age 5.

The in- and outmigration rates were based on in- and outmigration between 1975 and 1980 for each county, using a weight of 1.15 for inmigration rates and the same procedures described above for the state projections. Survival rates were based on Florida life tables for 1980, but for each county the survival rates were weighted averages of the state-level rates for whites and nonwhites. The weights were based on each county's proportion of white and nonwhite population in 1980. Thus the survival rates were somewhat different for each county, with the differences being determined by each county's racial structure. Similarly, county birth rates were weighted averages of state-level birth rates for whites and nonwhites, with the weights again determined by the 1980 proportion of whites and nonwhites in the county's population. The resulting total fertility rates ranged from 1.74 for Pasco County to 2.29 for Gadsden County.

In a number of counties, institutions account for a substantial proportion of total population. If the institutional population is following a different growth trend than the noninstitutional population in these counties, adjustments must be made before the usual projection techniques can be applied. In the present set of projections, adjustments for institutional populations were made for Alachua, Baker, Bradford, Gadsden, Leon, Monroe and Union counties. In these counties the birth, death and migration rates were applied only to the noninstitutional population, and independent projections of the institutional population were added as a final step. In all counties, the population projections by age and sex have been controlled to the medium series from the projections of total population published earlier this year (Bureau of Economic and Business Research, *Population Studies*, Bulletin No. 80, March 1987).

Note: This bulletin provides projections only for the condensed age groups of 0-14, 15-24, 25-44, 45-64, 65+ and 18+. Complete projections of the population by five-year age groups up to age 85+ are available. Separate projections of the white and nonwhite population are also available. Please contact the Bureau of Economic and Business Research for further information.
